20. ABSTRACT (Continue on reverse side if necessar) and identify by block number)  These volumes contain the experimental results rotation and group delay of VHF and UHF signal.  ATS-6 geostationary satellite at a station located faraday rotation data represents the electron convertical height of approximately 2000-3000 kilon	s transmitted from the d at Palehua, Hawaii. The ontent measured out to a
vertical height of approximately 2000-3000 kilometers, while the group	
delay is a measure of the total electron content along the entire path from	

DD FORM 1473

UNCLASSIFIED \

## 20. Abstract (continued)

station to the ATS-6 satellite. The difference between these two measures of electron content has been defined as the plasmaspheric electron content along the slant path from heights above 2000-3000 kilometers to the ATS-6 satellite.

Also included in the data tables are values of the equivalent vertical slab thickness defined as the ratio of vertical electron content obtained by the Faraday rotation measurement divided by the density at the peak of the ionospheric F region obtained from measurements of f0F2 from the Maui Ionosonde.

TOTAL ELECTRON CONTENTS

TABLES - 1978

## ATLAS OF ELECTRON CONTENT DATA - 1978

A companion volume contains diurnal This Atlas contains values of total Faraday and plasmaspheric electron contents of the ionosphere of slant ray path from the geostationary satellite ATS-6 to Hawaii. plots of these data. The nominal position of ATS-6 during 1978 was 0°N, 140°W, at a geocentric radius of 42.2Mm. The receiver The coordinates of the 400Km point was located at the Palehua Solar Observatory (21.4°N, 158.1°W) on the island of Oahu. Sub-ionospheric points at several altitudes along the ray path are shown in Figure 1. are (20.0°N, 156.8°W) Each dated page is based on Hawaiian time (HST = UT - 10), and thus contains data from UT = 10 of the date phase measurements using a Teledyne receiver and a student-built preamplifier. The Faraday content was deduced from polarization twist measured by Aldi Polarimeter, and assuming an effective layer height of 370 Km. The Plasmaspheric content is the difference (total - Faraday) of the above. The column at the shown to UT = 10 of the day following the date shown. The total content was obtained from modulationfar right is the equivalent slab thickness using Faraday content, Npeak from the Maui Ionosonde , and corrected to a vertical path. My appreciation goes to the students who put in many hours of work on this project, especially Ginni Mannion for her dedicated efforts in compiling and editing these data. I gratefully acknowledge the assistance, valuable discussions and support from Jack Klobuchar and AFGL (#F19628-28-C-0050), Richard F. Donnely and S. Dave Bouwer of S.E.L. - N.O.A.A., and the National Science Foundation.

Thomas H. Roelofs Professor of Electrical Engineering

LONGITUDE, DEGREES MEST

GRAPHS - 1978

## ATLAS OF ELECTRON CONTENT PLOTS - 1978

This Atlas contains diurnal plots of total, Faraday and plasmaspheric electron contents of the ionosphere of a slant ray path from the geostationary satellite ATS-6 to Hawaii. A companion volume contains data values at 15 minute intervals. The nominal position of ATS-6 during 1978 was 0°N, 140°W, at a geocentric radius of 42.2Mm. The receiver points at several altitudes along the ray path are shown in Figure 1. The geographic coordinates of the was located at the Palehua Solar Observatory (21.4°N, 158.1°W) on the island of Oahu. Sub-ionospheric 400 Km point are (20.0°N, 156.8°W). Each dated plot is based on Hawaiian time (HST = UT - 10), and thus contains data from UT = 10 of the date shown to UT = 10 of the day following the date shown. The total content (lower solid curve) was obtained assuming an effective layer height of 370 Km. The Plasmaspheric content (upper curve) is the difference Faraday content (dashed curve) was deduced from polarization twist measured by Aldi Polarimeter, and from modulation-phase measurements using a Teledyne receiver and a student-built preamplifier. The (total - Faraday) of the above curves.

assistance, valuable discussions and support from Jack Klobuchar and AFGL (#F19628-28-C-0050), Richard My appreciation goes to the students who put in many hours of work on this project, especially Ginni Mannion for her dedicated efforts in compiling and editing these data. I gratefully acknowledge the F. Donnely and S. Dave Bouwer of S.E.L. - N.O.A.A., and the National Science Foundation.

Thomas H. Roelofs Professor of Electrical Engineering
